TPG Italie (cybersécurité)

Introduction

In our world, technology is a great part of our life. It helps for hospitals, schools, banks, and even transport systems. This digital dependence can also be a weakness , creating serious risks. Cyberattacks can affect critical infrastructure, steal important data, and be a big threat to the security of europeans.

Our country thinks that cybersecurity is a responsibility that all should share . Cyber threats don't stop at the borders of the countries , and no one can face them alone. Cooperation is essential for the protection of all .

As a member of the EU , Italy is supporting action to avoid and react to cyber threats. Our country also believes that cybersecurity has to follow international law and basic human rights like privacy for all and the protection of data.

The creation of a national agency is a proof that Italy thinks that cybersecurity is a priority and supports organised systems of protection. In the first half of 2025, Italy faced a 53% increase in cyberattacks, including attacks affecting services like healthcare and energy. This augmentation led to the creation of the Agenzia per la Cybersicurezza Nazionale which has helped progress for the national cyber system , organising a response to cyber incidents. The country also works to protect critical sectors such as energy and finance.

Internationally, Italy would prefer to support cooperation against cybercrime ,under the Budapest Convention for example.

Italy proposes:

Better sharing of information between the states ,Stronger protection of critical infrastructure(hospitals airports, center of electricity), More support for developing countries to make better their cyber capacities, Clear international rules to reduce the risk of conflicts

Conclusion

Our country is convinced that a safe digital world needs cooperation, and responsibility. Italy counts on an efficient communication and hopes for decision to protect the European Union
